Requirements Prioritization

Project: E-commerce Platform for Electronic Gadgets

To ensure the platform delivers maximum value to both the business and end users, the functional requirements have been prioritized using the **MoSCoW method**.

1. Must Have

These are critical features without which the platform cannot function:

- User registration and authentication
- Product browsing and search with filters
- Product detail pages with images, specifications, and pricing
- Shopping cart and secure checkout process
- Multiple payment options (credit/debit cards, UPI, wallets)
- Order confirmation and tracking
- User profile with saved addresses and order history

2. Should Have

These are important features that enhance usability and customer satisfaction, but the system can operate without them in the first release:

- Product reviews and ratings
- Similar product suggestions or recommendations
- Ability to cancel orders before dispatch
- Email/SMS notifications for order updates

3. Could Have

These are desirable features that can provide competitive advantage but are not essential in the initial release:

- Personalized product recommendations based on browsing history
- Discount coupons and promotional offers
- Gift-wrapping options for special occasions

4. Won't Have (for initial phase)

These are features intentionally excluded from the current scope due to time, budget, or complexity. They may be considered in future phases:

- Integration with third-party marketplaces (Amazon, Flipkart, etc.)
- Advanced AR/VR-based product previews
- Multi-language or multi-currency support
- Loyalty or subscription programs

This prioritization ensures that the **core business needs are met first**, while still leaving room for future improvements.

Basis for Requirement Prioritization – Factors Contribute in prioritizing requirements

1. **Business Value**
    - Features that directly contribute to revenue generation, market reach, or customer satisfaction are prioritized higher.
2. **User Needs**
    - Requirements that improve the customer experience, reduce friction, and fulfill essential user journeys are given priority.
3. **Dependencies**
    - Some features cannot function without others, so foundational requirements are prioritized first.
    - Example: User Registration must be built before Order Tracking can work.
4. **Cost and Effort**
    - Features that deliver high business value with relatively low cost/effort may be prioritized earlier.
5. **Time Sensitivity**
    - Features that are crucial for early releases or tied to deadlines (e.g., launch before a sales season) are prioritized higher.
6. **Competitors Advantage**
    - Features that differentiate the platform from competitors or help match industry standards are prioritized strategically.
